

Practical-4

AIM : Implementation and Time analysis of factorial program using iterative and recursive method

Factorial using Iterative Method

ALGORITHM:

CODE:

```
#include <iostream>

using namespace std;

int factorial(int n)
{
```

```
int fact = 1; for(int i = 1; i <= n; i++)
{
    fact = fact * i;
}
return fact;
}
int main()
{
    int n;
    cout << "Enter a number: ";
    cin >> n;
    cout << "Factorial = " << factorial(n);
    return 0;
}
```

OUTPUT:

Output

Enter a number: 5

Factorial = 120

=== Code Execution Successful ===

TIME COMPLEXITY :

CONCLUSION:

The factorial program was successfully implemented using both iterative and recursive methods. Both methods produce the same result, but the recursive method uses function calls and stack space. The time complexity of both methods is $O(n)$, making them efficient for calculating factorials.
